

Luca DESCRAMBES (23040108)

BestKorea.

The goal of this projet was to make a serious front page from a travel company, a login system and some interaction with the site with forms. The user is able to contact the administrator of the website using a form and the administrator is able to see all message sent using a hidden admin panel. If the user is registered, his email and name is already saved into a php session so he can directly send the message. Otherwise, the user need to specify its name and email address.

Header and image carousel with animation and possibility to view some landscape from Korea

Two information cards which can be extended to view more detailed information if the user clicks on the button. Here the user is logout so he needs to enter a name and email address to contact the web administrator.

GO WITH YOUR FAMILY

With BestKorea, it is easy to travel around Korea. You are a solo traveler or want to travel with a party, no problem, we can find you the best accomodation around hundreds of places because you deserve the right to stay in a good place. Please make sure to specify the number of people when you are reserving so our system can detect the best location for you.

For more information, please contact us via the form [here](#).

OK

The user is an admin, he can see all the message sent and saved into the database. Only the administrator can see this page. An administrator is defined when a new user create an account and it is the first user in the database. You can access this page using the main page and click the « Panel Message » on the header.

ID	Username	Email	Message	UserID
1	Bob	bob@gmail.com	Hello this is Bob!	0
2	Luca	luca.descrambes@epita.fr	Hello this is admin	1
3	Alice	alice@gmail.com	Hello this is Alice	2

The login page, if the user is not found, it will be redirected into this page with a visual indication that either the email or password is incorrect
You can create an account with the « No account » button

Login Page

**Email:****Password:****LOGIN**

**No account?
Register here.**

The registration page, if the password is not correct in the two field, you cannot create the account. Once the account is created, you will be redirected in the main page

Overall in this project, I used HTML, CSS, Javascript, PHP and MySQL to create a serious front page from a travel company. I used a database to store user information and message sent from the form. I created a login and register system and also an admin panel. Right now the destinations and personal guide button redirect to an In Progress webpage. I used Javascript for the image carousel in the main page to show various landscape from Korea. The user can play with it. I also used it for the information cards button. I used MySQL and PHP for the login system and the admin panel page.

All the code is from me

Major code description : I used session to keep user authentication between webpages I did some HTML and CSS (everything was seen in class)

For the javascript part, I used global variable to communication between the function. The carousel used a asynchronous loop which is repeated every 5 seconds, the global variable is used as locks (if the user keep the mouse over the div). Apart from that it is straight forward
